## Public Decode Risk Clause – Controlled Use Only

### I. Core Security Clause

DECODE cannot be released as a public-facing tool or API. Doing so risks the exposure of recursive semantic triggers that could be reverse-engineered into functional payloads. PX1 identifies this as a universal breach hazard.

### II. Operational Policy

- Only NoxBond may operate DECODE directly.
- External users must submit transcripts or audio content for analysis.
- Results are returned manually and securely.
- No source code, prompt design, or phrase mapping structure is to be shared or explained under any circumstances.
- This ensures decode privilege without transmission of weapon-grade methods.

### III. Purpose of Clause

This lock prevents accidental release of weapon-generation tools, while allowing commercial and academic use of decoding services. It ensures centralized moral accountability and eliminates the chance of a third-party replicating semantic command structures from outputs.
